I would like to modify a dataset (master) with the data of another dataset (transaction) and, if the key matches go in replacement, otherwise append in the new data. The result, unexpected is that for `cod_cli = 2` not only replaces data (correctly) but appends them also under: `data master (index=...`

Solved: modify dataset with index
- SAS Support Communities

An index is an optional file that you can create for a SAS data file in order to provide direct access to specific observations. The index stores values in ascending value order for a specific variable or variables and includes information as to the location of

A-index - Sas Institute
For the SET and MODIFY statements, the KEY= option enables you to specify an index in a DATA step to retrieve particular observations in a data file.; In addition, an index can benefit other areas of SAS. In SCL (SAS Component Language), an index improves the performance of table lookup operations. For the SQL procedure, an index enables the software to process certain classes of queries more ...

SAS Help Center: Modifying a Master Data Set with ...

The UNIQUE option causes SAS to return to the top of the master data set before retrieving a match for the index value. You must write an accumulation statement to accumulate the values from all the duplicates. If you do not, only the last one applied is the result in the master observation.

9.2 - SAS Customer Support Site | SAS Support

The most common index is a simple index, which is an index of values for one key variable. The variable can be numeric or character. When you create a simple index, SAS assigns to the index the name of the key variable.
