Pneumatic conveying of malted barley is a crucial step in making our award winning beers. Unlike agars, the custom design layout and years of consistent operation has proven that pneumatic conveying is a superior grain handling system. By using air to gently move our malt we cut costs, increase production and ensure a world

class quality product.

Pneu-Con: Pneumatic Conveying Systems
for Dry Bulk

Pneumatic conveying is a process of transferring bulk materials from one location to another in a pipeline by means of gas such as compressed air or nitrogen.

Where To Download Pneumatic Conveying

Pneumatic Conveying was developed as an alternative to mechanical systems such as belt conveyors, screw conveyors, drag conveyors etc., and offers such advantages as:

Pneumatic Conveying | Macawber

Where To Download Pneumatic Conveying Engineering

As a result dilute phase is probably the most common form of pneumatic conveying for this group of materials. A much higher conveying line inlet air velocity must be maintained for dilute phase systems, even if the material is capable of being conveyed in dense phase.

Dense phase pneumatic conveying is the

Where To Download Pneumatic Conveying

high pressure (<15psi), low velocity (2-15 feet/sec) transfer of dry, bulk materials.

Material is gently conveyed using compressed gas or nitrogen through the convey pipe in a continuous dense phase, short slug, or bed flow below the saltation velocity which is where the material is lifted into the airstream.

Pneumatic conveying can be separated into two categories, lean phase and dense phase. Lean phase: Lean phase conveying is the most common conveying method for powders or granules and can generally be split into two further categories: Dilute phase: where conveying gas velocities are typically in excess of 17-18 m/s and
